Abstract

This paper considered the formulation of continuous third derivative trigonometrically fitted block method for the solution of stiff and oscillatory problems. The development of the technique involved the interpolation and collocation of the approximate solution which is the combination of polynomial and trigonometric functions. Solving for the unknown parameters and substituting the results into the approximate solution yielded a continuous linear multistep method, which is evaluated at some selected grid points where two cases were considered at equal intervals to give the discrete schemes which are implemented in block form. The blocks are convergent and stable. Numerical experiments show that the methods compete favorably with existing method and efficient for the solution of stiff and oscillatory problems.

1. Introduction

In science and engineering, mathematical models are developed to help in the studying of physical phenomena, these models often yield equations that contain some derivatives of an unknown function of one or several variables, such equations are called Differential Equations (DEs) \cite{1, 2}. Interestingly, systems described by differential equations are so complex, or the systems that they describe are so large, that a purely analytical solution to the equations is not tractable, hence the need for numerical approximation \cite{3}.

Block method is formulated in terms of LMM, It preserves the traditional advantage of one step methods, of being self-starting and permitting easy change of step length \cite{1, 4}. The advantages of block methods over predictor-corrector methods lies in the fact that they are less expensive in terms of number of functions evaluation, it is capable of giving evaluations at different grid points, without overlapping as done in the predictor-corrector method and it generates simultaneous solutions at all grid points \cite{1, 4, 5}.

Despite the success recorded by linear multistep method (LMM) in the numerical solution of initial value problems, most of the approaches failed when the problems are stiff. Adoption of trigonometrically fitted approximate solution as basis functions have been effective in handling this setback, but their de-
developments are tedious. In this paper, we consider numerical procedures for approximating the solution of stiff and oscillatory problems of the form

\[ y' = f(x, y), \quad y(x_0) = \eta_0. \tag{1} \]

These type of differential equations are known to be highly oscillatory and some problems have special properties such as discontinuity and stiffness, hence it is quite difficult to get their numerical solutions accurately [6, 2]. They are numerically unstable, unless the step size is taken to be extremely small [7]. A stiff system is one involving rapidly changing components together with slowly changing ones, stiff systems are sometimes referred to as systems with large Lipschitz constant [7, 8]. The system of (1) is stiff if the eigenvalues of the matrix have negative real parts at every time \( x \) and varies greatly in magnitude [9, 10]. Oscillation is the repetitive variation, typically in time, of some measure about a central value (often a point of equilibrium) or between two or more different states [7].

This type of problem arises in different fields of science and engineering, which includes quantum mechanics, celestial mechanics, molecular dynamics, quantum chemistry, astrophysics, electronics and semi-discretizations of wave equation [5, 11].

Numerous numerical methods have been derived for approximating the solutions of (1), some of which are Linear Multistep Methods (LMMs) [12, 13, 4, 14], Block method [5, 15, 1, 16, 17, 18, 19, 20], Trigonometrically fitted methods [21, 22, 23, 6, 24]. Other methods for the solution of Stiff and oscillatory problems includes [2, 9, 11]. Modeled problems in engineering and sciences leads to complex problems such as stiff and oscillatory problems. It was observed that LMM fails to converge at the state of oscillatory as a result has poor stability properties [7]. Second derivative formulas with trigonometric basis functions seems to solve such problems very well and has a better and stability properties [1, 17], [25, 26] develop an algorithm for the solution of Stiff Initial Value Problems.

Furthermore, [27, 28] considers an implicit \( r \)-point block backward differentiation formula (BBDF) and block method that generates two values simultaneously respectively for solving stiff IVPs of ODEs. The \( r \)-point block method simultaneously produces \( r \)-new values at the time discretization points. The total number of steps to complete the integration by the methods are reduced but not sufficiently and the computation time for the method can still be reduced. [29] developed a block integrator for the solution of stiff and oscillatory first order IVPs of ODEs by means of collocation and interpolation of the combination of power series and exponential function to generate a continuous implicit linear multistep method.

Despite the success achieved by the above methods, it increases the dimension of the resulting systems of first order by the order of the differential equation, hence it wastes both the computer and human effort. Polynomial approximate solution has been reported not to be efficient in handling stiff oscillatory problems, trigonometrically fitted methods handle oscillatory problems effectively, but the application of higher derivatives methods for the solution of first order oscillatory initial value problems has not given much attention.

In this paper Continuous Trigonometrically Fitted Third Derivative Method (CTFTDM) is constructed which provides a discrete method for direct solution of first order initial value problems. The coefficients of the TFTDM are functions of the frequency and the step-size, hence the solutions that will be provided by the methods will be highly accurate if (1) has periodic solutions with the unknown frequencies. This new method considers the application of higher derivative and does not waste both the computer and human effort which is efficient in handling stiff oscillatory problems. Trigonometrically fitted methods are powerful tool in handling stiff/oscillatory problems, order 2 methods developed by combining polynomial and trigonometric approximate solution and considering higher derivatives, conveniently solved stiff/oscillatory problems and it perform better than other methods of the same order.

1.1. Preliminaries

Definition 1.1. Stiff [8]: The system

\[ \dot{y} = Ay + \phi(x) \]

where \( A \) is an \( m \times m \) matrix and \( \phi(x) \) an \( m \) dimensional vector, is said to be stiff if

\[ \Re \lambda_i < 0, \ i = 1, 2, \ldots, m \]

and

\[ \frac{\max_{i=1,\ldots,m} |\Re \lambda_i|}{\min_{i=1,\ldots,m} |\Re \lambda_i|} \geq 0 \]

where \( \lambda_i, i = 1, 2, \ldots, m \) are the eigenvalues of \( A \). The ratio

\[ S = \frac{\max_{i=1,\ldots,m} |\Re \lambda_i|}{\min_{i=1,\ldots,m} |\Re \lambda_i|} \geq 0 \]

is called the stiffness ratio.

Theorem 1.2. Consistency [30]: A block method is said to be consistent if it has order \( p \geq 1 \).

Theorem 1.3. Zero-stable [30]: A block method is said to be zero stable if as \( h \to 0 \), the roots \( r_j, j = 1(1)k \) of the first characteristic polynomials \( \rho(r) = 0 \) that is

\[ \rho(r) = \det \left[ \sum A^{(0)} R^{k-1} \right] = 0 \]

satisfying \( |R| \leq 1 \), must be simple.

Theorem 1.4. Convergent [31]: Consistent and zero stability are sufficient conditions for a block method to be convergent.

2. Methodology

We considered the approximate solution

\[ y(x) = \sum_{n=0}^{2} \alpha_n x^n + \sum_{n=1}^{2} \beta_n \sin n\omega x + \sum_{n=1}^{2} c_n \cos n\omega x \tag{2} \]
where $\omega = \frac{2\pi n}{T}$, $T$ is the period of the oscillation, $\alpha'$s, $\beta'$s and $c'$s are parameters to be determined.

Interpolating (2) at point $x_n$, collocating the first derivative of (2) at point $x_n, x_{n+u}, x_{n+v}$, collocating the second derivative of (2) at point $x_{n+u}, x_{n+v}$, and collocating the third derivative of (2) at point $x_{n+v}$ for $u$ and $v$, $u < v$ to obtain the system

$$XA = U$$

where

$$A = \begin{bmatrix} \alpha_1 & \beta_1 & \beta_2 & \beta_3 & c_1 & c_2 & d_2 \end{bmatrix}^T$$

$$U = \begin{bmatrix} y_n & f_n & f_{n+u} & f_{n+v} & g_{n+u} & g_{n+v} & l_{n+v} \end{bmatrix}^T$$

$$X = \begin{bmatrix} x_n & x_n^2 & \sin \omega x_n & \sin 2\omega x_n & \cos \omega x_n & \cos 2\omega x_n \\ 0 & 1 & 2x_n & \omega \cos \omega x_{n+u} & 2\omega \cos 2\omega x_n & -\omega \sin \omega x_n & -2\omega \sin 2\omega x_n \\ 0 & 1 & 2x_{n+u} & \omega \cos \omega x_{n+u} & 2\omega \cos 2\omega x_{n+u} & -\omega \sin \omega x_{n+u} & -2\omega \sin 2\omega x_{n+u} \\ 0 & 1 & 2x_{n+v} & \omega \cos \omega x_{n+v} & 2\omega \cos 2\omega x_{n+v} & -\omega \sin \omega x_{n+v} & -2\omega \sin 2\omega x_{n+v} \\ 0 & 0 & 2 & -\omega^2 \sin \omega x_{n+u} -4\omega^2 \sin 2\omega x_{n+u} & -\omega^2 \cos \omega x_{n+u} & -4\omega^2 \cos 2\omega x_{n+u} \\ 0 & 0 & 2 & -\omega^2 \sin \omega x_{n+v} -4\omega^2 \sin 2\omega x_{n+v} & -\omega^2 \cos \omega x_{n+v} & -4\omega^2 \cos 2\omega x_{n+v} \\ 0 & 0 & 0 & -\omega^3 \cos \omega x_{n+u} -8\omega^3 \cos 2\omega x_{n+u} & \omega^3 \sin \omega x_{n+u} & 8\omega^3 \sin 2\omega x_{n+u} \end{bmatrix}$$

(3) gives system of nonlinear equations which is then solved using Newton Raphson’s method.

Now considering two cases of third derivative trigonometrically fitted methods at equal intervals as specified below

Case I: $u = \frac{1}{2}$, $v = 1$
Case II: $u = 1$, $v = 2$

2.1. Block Method for Case I

Considering $u = \frac{1}{2}, v = 1$

$$y_{n+\frac{1}{2}} = \alpha_{01} y_n + \beta_{01} f_n + \beta_{11} f_{n+\frac{1}{2}} + \beta_{21} f_{n+1} + \gamma_{n+\frac{1}{2}} g_{n+1}$$

$$+ \gamma_{n+1} g_{n+2} + [l_{n+2} (t \xi_{n+2})]$$

Evaluating (4) at $t = \frac{1}{2}$ yields

$$y_{n+\frac{1}{2}} = \alpha_{01} y_n + \beta_{01} f_n + \beta_{11} f_{n+\frac{1}{2}} + \beta_{21} f_{n+1} + \gamma_{11} g_{n+\frac{1}{2}}$$

$$+ \gamma_{21} g_{n+1} + \xi_{11} g_{n+2}$$

where

$$\alpha_{01} = 1$$

$$\beta_{01} = \frac{1}{4} \begin{bmatrix} 8 \cos h\omega + 60 \cos 2h\omega + 104 \cos \frac{1}{2}h\omega - 94 \cos \frac{3}{2}h\omega - 10 \cos \frac{5}{2}h\omega + 30h^2 \omega^2 \\ +6h^2 \omega^2 \cos h\omega - 33h^2 \omega^2 \cos \frac{1}{2}h\omega - 3h^2 \omega^2 \cos \frac{3}{2}h\omega + 8h\omega \sin h\omega \\ +8h\omega \sin 2h\omega - 56h\omega \sin \frac{1}{2}h\omega + 6h\omega \sin \frac{1}{2}h\omega - 2h\omega \sin \frac{3}{2}h\omega - 68 \end{bmatrix}$$

$$\beta_{11} = \frac{1}{4} \begin{bmatrix} 164 \cos h\omega - 44 \cos 2h\omega - 4 \cos 3h\omega + 20 \cos \frac{1}{2}h\omega - 42 \cos \frac{3}{2}h\omega \\ +22 \cos \frac{1}{2}h\omega + 18h^2 \omega^2 + 6h^2 \omega^2 \cos 2h\omega - 30h^2 \omega^2 \cos \frac{1}{2}h\omega \\ +9h^2 \omega^2 \cos \frac{1}{2}h\omega - 3h^2 \omega^2 \cos \frac{3}{2}h\omega + 32h\omega \sin h\omega - 40h\omega \sin 2h\omega \\ +28h\omega \sin \frac{1}{2}h\omega + 6h\omega \sin \frac{1}{2}h\omega + 10h\omega \sin \frac{3}{2}h\omega - 116 \end{bmatrix}$$

$$\beta_{21} = \frac{1}{4} \begin{bmatrix} 12 \sin h\omega - 22 \sin 2h\omega - 42 \sin \frac{1}{2}h\omega + 27 \sin \frac{3}{2}h\omega + 5 \sin \frac{5}{2}h\omega + 26h\omega \\ +4h\omega \cos h\omega + 2h\omega \cos 2h\omega - 32h\omega \cos \frac{1}{2}h\omega + h\omega \cos \frac{3}{2}h\omega - h\omega \cos \frac{5}{2}h\omega \end{bmatrix}$$

$$\begin{bmatrix} -172 \cos h\omega - 16 \cos 2h\omega + 4 \cos 3h\omega - 124 \cos \frac{1}{2}h\omega + 36 \cos \frac{3}{2}h\omega \\ -12 \cos \frac{1}{2}h\omega + 4h^2 \omega^2 + 2h^2 \omega^2 \cos h\omega - 2h^2 \omega^2 \cos \frac{1}{2}h\omega - 4h^2 \omega^2 \cos \frac{3}{2}h\omega - 16h\omega \sin h\omega - 12h\omega \sin 2h\omega \\ -56h\omega \sin \frac{1}{2}h\omega + 42h\omega \sin \frac{3}{2}h\omega + 2h\omega \sin \frac{5}{2}h\omega + 184 \end{bmatrix}$$

$$\begin{bmatrix} 12 \sin h\omega - 22 \sin 2h\omega - 42 \sin \frac{1}{2}h\omega + 27 \sin \frac{3}{2}h\omega + 5 \sin \frac{5}{2}h\omega + 26h\omega \\ +4h\omega \cos h\omega + 2h\omega \cos 2h\omega - 32h\omega \cos \frac{1}{2}h\omega + h\omega \cos \frac{3}{2}h\omega - h\omega \cos \frac{5}{2}h\omega \end{bmatrix}$$
Evaluating (4) at $t = 1$

$$y_{n+1} = \alpha_{02}y_n + \beta_{02}f_n + \beta_{12}f_{n+\frac{1}{2}} + \beta_{22}f_{n+1} + \gamma_{12}g_{n+\frac{1}{2}} + \gamma_{22}g_{n+1} + \xi_{12}n_{n+1} + \xi_{22}n_{n+1}$$  (6)

Where

$$\alpha_{02} = 1$$

$$\beta_{02} = \frac{1}{2} \left[ \begin{array}{c}
32 \cos h\omega - 30 \cos 2h\omega - 34 \cos \frac{1}{2} h\omega + 29 \cos \frac{1}{3} h\omega + 5 \cos \frac{5}{7} h\omega - 20\frac{2}{5} \omega^2 \\
+18\omega^2 \cos \frac{1}{7} h\omega + 2h^2 \omega^2 \cos \frac{3}{7} h\omega - 16\omega \sin h\omega - 4\omega \sin 2h\omega \\
70\omega \sin \frac{1}{2} h\omega - 9\omega \sin \frac{3}{2} h\omega + h\omega \sin \frac{5}{2} h\omega - 2
\end{array} \right]$$

$$\beta_{12} = \frac{1}{2} \omega \left[ \begin{array}{c}
65 \cos h\omega - 20 \cos 2h\omega - 2 \cos \frac{1}{2} h\omega + 2 \cos \frac{1}{3} h\omega + 9 \cos \frac{1}{5} h\omega - 9 \cos \frac{3}{7} h\omega \\
+7 \cos \frac{1}{7} h\omega + 6h^2 \omega^2 + 4h^2 \omega^2 \cos h\omega + 2h^2 \omega^2 \cos 2h\omega \\
+3h^2 \omega^2 \cos \frac{3}{7} h\omega - 3h^2 \omega^2 \cos \frac{5}{2} h\omega + 8\omega \sin h\omega - 16\omega \sin 2h\omega \\
-14h^2 \omega^2 \cos \frac{1}{7} h\omega + 28\omega \sin \frac{1}{2} h\omega + 4\omega \sin \frac{3}{2} h\omega - 44
\end{array} \right]$$

$$\beta_{22} = -\frac{1}{2} \omega \left[ \begin{array}{c}
98 \cos h\omega - 10 \cos 2h\omega - 2 \cos \frac{1}{2} h\omega - 2 \cos \frac{1}{3} h\omega + 38 \cos \frac{1}{5} h\omega - 47 \cos \frac{3}{7} h\omega \\
+9 \cos \frac{7}{7} h\omega - 20h^2 \omega^2 + 18h^2 \omega^2 \cos \frac{1}{7} h\omega + 2h^2 \omega^2 \cos \frac{5}{7} h\omega \\
+8\omega \sin h\omega + 16\omega \sin 2h\omega + 70\omega \sin \frac{1}{2} h\omega - 45\omega \sin \frac{3}{2} h\omega \\
-3\omega \sin \frac{1}{2} h\omega - 86
\end{array} \right]$$

$$\gamma_{12} = \frac{1}{2} \omega^2 \left[ \begin{array}{c}
12 \sin h\omega - 22 \sin 2h\omega - 42 \sin \frac{1}{2} h\omega + 27 \sin \frac{3}{2} h\omega + 3 \sin \frac{1}{7} h\omega - 6 \sin \frac{5}{7} h\omega \\
+6 \sin \frac{3}{7} h\omega - 26\omega \sin h\omega + 2h^2 \omega^2 \sin 2h\omega + 4h^2 \omega^2 \sin \frac{1}{7} h\omega \\
-6h^2 \omega^2 \sin \frac{3}{7} h\omega - 2h^2 \omega^2 \sin \frac{5}{7} h\omega + 17\omega \cos h\omega + 10\omega \cos 2h\omega \\
-h\omega \cos 3h\omega + 8\omega \cos \frac{1}{7} h\omega - 8\omega \cos \frac{3}{7} h\omega
\end{array} \right]$$
\[
\gamma_{22} = \frac{1}{2} \begin{bmatrix}
-39 \sin h\omega + 24 \sin 2h\omega - 3 \sin 3h\omega + 12 \sin \frac{1}{2}h\omega + 6 \sin \frac{3}{2}h\omega \\
-6 \sin \frac{3}{2}h\omega - 16h\omega + 4h^2\omega^2 \sin h\omega + 8h^2\omega^2 \sin 2h\omega \\
-4h^2\omega^2 \sin \frac{3}{2}h\omega - 12h^2\omega^2 \sin \frac{1}{2}h\omega + 16h\omega \cos h\omega + 28h\omega \cos \frac{1}{2}h\omega \\
-38h\omega \cos \frac{3}{2}h\omega + 10h\omega \cos \frac{1}{2}h\omega
\end{bmatrix}
\]

\[
\omega^2 = \begin{bmatrix}
12 \sin h\omega - 22 \sin 2h\omega - 42 \sin \frac{1}{2}h\omega + 27 \sin \frac{3}{2}h\omega + 5 \sin \frac{5}{2}h\omega \\
+26h\omega + 4h\omega \cos h\omega + 2h\omega \cos 2h\omega - 32h\omega \cos \frac{1}{2}h\omega + h\omega \cos \frac{3}{2}h\omega
\end{bmatrix}
\]

\[
\omega^3 = \begin{bmatrix}
12 \sin h\omega - 22 \sin 2h\omega - 42 \sin \frac{1}{2}h\omega + 27 \sin \frac{3}{2}h\omega + 5 \sin \frac{5}{2}h\omega \\
+26h\omega + 4h\omega \cos h\omega + 2h\omega \cos 2h\omega - 32h\omega \cos \frac{1}{2}h\omega + h\omega \cos \frac{3}{2}h\omega
\end{bmatrix}
\]

writing (5) and (6) in discrete block method

\[
\begin{bmatrix}
1 & 0 \\
0 & 1
\end{bmatrix} \begin{bmatrix}
y_{n+\frac{1}{2}} \\
y_{n+1}
\end{bmatrix} = \begin{bmatrix}
0 & 1 \\
0 & 1
\end{bmatrix} \begin{bmatrix}
y_{n-1} \\
y_{n}
\end{bmatrix} + \begin{bmatrix}
0 & 0 \beta_{01} & \cdots & 0 & 0 \beta_{p0}
\end{bmatrix} \begin{bmatrix}
f_{n-1} \\
f_{n}
\end{bmatrix}
\]

\[
\begin{bmatrix}
\beta_{11} & \beta_{12} \\
\beta_{21} & \beta_{22}
\end{bmatrix} \begin{bmatrix}
f_{n+\frac{1}{2}} \\
f_{n+1}
\end{bmatrix} + \begin{bmatrix}
\gamma_{11} & \gamma_{12} \\
\gamma_{21} & \gamma_{22}
\end{bmatrix} \begin{bmatrix}
\xi_{n+\frac{1}{2}} \\
\xi_{n+1}
\end{bmatrix} + \begin{bmatrix}
0 & 0 \xi_{11} & \cdots & 0 & 0 \xi_{p1}
\end{bmatrix} \begin{bmatrix}
l_{n-1} \\
l_{n+1}
\end{bmatrix}
\]

(7)

2.2. Analysis of the Stability Properties for Case I

2.2.1. Order and error constant

Evaluating each row of (5) and (6) in Taylor series about \( x_n \) gives

\[
L \left[ y(x); h \right] = y_{n+\frac{1}{2}} - y_n - h \frac{\partial y}{\partial x} |_{x_n} - \beta_{01} f_n - \beta_{11} f_{n+\frac{1}{2}} - \beta_{21} f_{n+1} - \gamma_{11} g_{n+\frac{1}{2}} - \gamma_{21} g_{n+1} - \gamma_{11} l_{n+1} = 0
\]

therefore, the block methods are of order \( p = (2,2)^T \) with the following error constants

\[
k = \frac{-1978 \cos h\omega + 12 \cos 3h\omega + 36 \cos \frac{1}{2}h\omega + 198 \cos \frac{3}{2}h\omega}{96 \omega^3}
\]

\[
k = \frac{756 \cos h\omega - 120 \cos 2h\omega - 12 \cos 3h\omega + 288 \cos \frac{1}{2}h\omega - 132 \cos \frac{3}{2}h\omega + 4 \cos \frac{5}{2}h\omega}{24 \omega^3}
\]

\[
\bar{\rho}(\lambda) = \det \left[ \lambda A^{(1)} - A^{(0)} \right] = 0
\]

(8)
where $A^{(0)}, A^{(1)}$ are from (7)

$$
A \begin{bmatrix} 1 & 0 \\ 0 & 1 \end{bmatrix} - A \begin{bmatrix} 0 & 1 \\ 0 & 1 \end{bmatrix} = \det \begin{bmatrix} \lambda & -1 \\ 0 & \lambda - 1 \end{bmatrix}, A^2 - \lambda A (\lambda - 1) = 0
$$

Thus, solving for $\lambda$

$$
\lambda (\lambda - 1) = 0
$$

which implies that $\lambda_1 = 0, \lambda_2 = 1$. Hence, using theorem 1, theorem 2, theorem 3, the block method (7) is zero stable and also consistent as its order $p = [2, 2]^T > 1$, thus it is convergent.

2.2.3. Linear stability

Applying the test equation $y^{(k)} = A^{(k)}y_n$ to yield $y_{n+1} = \mu(z)y_m$, $\mu(z)$ is the amplification equation given by

$$
\mu(z) = -\left(A^{(1)} - z\beta^{(1)} - z\gamma^{(1)} - z^2\xi^{(1)}\right)^{-1}\left(A^{(0)} + z^2\beta^{(0)} + z^3\gamma^{(0)}\right)
$$

(9)

where $A^{(0)} = \begin{bmatrix} 0 & 1 \\ 0 & 1 \end{bmatrix}, \beta^{(0)} = \begin{bmatrix} 0 & \beta_{01} \\ 0 & \beta_{02} \end{bmatrix}, \gamma^{(0)} = \begin{bmatrix} 0 & \xi_{11} \\ 0 & \xi_{21} \end{bmatrix}, A^{(1)} = \begin{bmatrix} 1 & 0 \\ 1 & 0 \end{bmatrix}, \beta^{(1)} = \begin{bmatrix} \beta_{11} & \beta_{21} \\ \beta_{12} & \beta_{22} \end{bmatrix}$ and $\gamma^{(1)} = \begin{bmatrix} \gamma_{11} & \gamma_{12} \\ \gamma_{21} & \gamma_{22} \end{bmatrix}$

the matrix $\mu(z)$ has eigenvalues $(0, 0, ..., \xi_k)$ where $\xi_k$ is called the stability function which is the rational function with coefficients.

$$
\mu(z) = \frac{72z - 234z^2h + 9z^3h^3 - 102z^2h^2 + 27z^2h^4 + 126zh^5 - 60zh^3\omega^4 + 64zh^4\omega^4 + 210zh^2\omega^2 + 210zh^3\omega^2 - 108zh^3\omega^4}{72z - 180z^2h^3 + 42z^3h^2 + 45z^4h^3 - 60h^3\omega^4 + 210zh^2\omega^2 - 112z^2h^3\omega^4 + 180z^2h^3\omega^2 - 135z^3h^4\omega^4 + 42z^2h^5\omega^4}, 0
$$

2.2.4. Region of absolute stability

The region of absolute stability of the block method (7) is shown in Figure 1.

![Figure 1. Region of Absolute Stability for Case I](image)

2.3. Block Method for Case II

We considered $u = 1, v = 2$

$$
y_{n+1} = \alpha_0(t)y_n + \beta_0(t)f_n + \beta_1(t)f_{n+1} + \beta_2(t)f_{n+2} + \gamma_{n+1}(t)g_{n+1} + \gamma_{n+2}(t)g_{n+2} + \zeta_{n+2}(t)l_{n+2}
$$

(10)

Evaluating (4) at $t = 1$ yields

$$
y_{n+1} = \alpha_{01}y_n + [\beta_{01}f_n + \beta_{11}f_{n+1} + \beta_{21}f_{n+2}] + [\gamma_{11}g_{n+1} + \gamma_{21}g_{n+2}] + \zeta_{11}l_{n+2}
$$

(11)
where

\[
\alpha_{11} = 1
\]

\[
\beta_{01} = \begin{cases}
\frac{1}{2} & -52 \cos h\omega - 4 \cos 2h\omega + 47 \cos 3h\omega - 30 \cos 4h\omega \\

-2h\omega \cos 3h\omega - 4h\omega \cos 4h\omega + 2h\omega \cos 5h\omega
\end{bmatrix}

-5 \sin 5h\omega - 52h\omega + 64h\omega \cos h\omega - 8h\omega \cos 2h\omega \\
-2h\omega \cos 3h\omega - 4h\omega \cos 4h\omega + 2h\omega \cos 5h\omega
\]

writing (11) and (12) in discrete block method

\[
\begin{bmatrix}
1 & 0 & y_{n+1} \\
0 & 1 & y_{n+2}
\end{bmatrix}
+ \begin{bmatrix}
\beta_{11} & \beta_{21} & f_{n+1} \\
\beta_{12} & \beta_{22} & f_{n+2}
\end{bmatrix}
= \begin{bmatrix}
1 & 0 & y_{n} \\
0 & 1 & y_{n+1}
\end{bmatrix}
+ \begin{bmatrix}
0 & \beta_{01} & f_{n-1} \\
0 & \beta_{02} & f_{n}
\end{bmatrix}
+ \begin{bmatrix}
\gamma_{11} & \gamma_{12} & g_{n+1} \\
\gamma_{21} & \gamma_{22} & g_{n+2}
\end{bmatrix}
+ \begin{bmatrix}
0 & \zeta_{11} & l_{n-1} \\
0 & \zeta_{21} & l_{n+1}
\end{bmatrix}
\]
2.4. Analysis of the Stability Properties for Case II

2.4.1. Order and error constant

Evaluating each row of (11) and (12) in Taylor series about \( x_n \) gives

\[
L[y(x); h] = y_{n+1} - y_n - \beta_0 f_n - \beta_1 f_{n+1} - \beta_2 f_{n+2} - \gamma_1 g_{n+1} - \gamma_2 g_{n+2} - \xi_1 h_{n+2} = 0
\]

therefore, the methods are of order \( p = (2, 2)^T \) with the following error constants

\[
k = -1 \quad \frac{1}{12} \begin{bmatrix}
216 \cos h w + 334 \cos 2hw - 204 \cos 3hw + 48 \cos 4hw \\
-12 \cos 5hw + 6 \cos 6hw - 258h^2 \omega^2 - 100h^4 \omega^4 + 294h^2 \omega^2 \cos hw \\
-426h^2 \omega^2 \cos 2hw + 669h^2 \omega^2 \cos 3hw - 270h^2 \omega^2 \cos 4hw \\
+76h^4 \omega^4 \cos hw - 3h^2 \omega^2 \cos 5hw - 6h^2 \omega^2 \cos 6hw - 32h^2 \omega^2 \cos 2hw \\
+46h^4 \omega^4 \cos 3hw + 20h^4 \omega^4 \cos 4hw - 10h^4 \omega^4 \cos 5hw + 216h^3 \omega \sin hw \\
-24h^3 \omega^3 \sin 2hw - 180h^3 \omega \sin 3hw - 212h^3 \omega^3 \sin 4hw + 28h^3 \omega^3 \sin 5hw \\
-72hw \sin hw + 594hw \sin 2hw - 576hw \sin 3hw + 156hw \sin 4hw \\
-24hw \sin 5hw + 18hw \sin 6hw - 288
\end{bmatrix}
\]

\[
k = -1 \quad \frac{1}{6} \begin{bmatrix}
72 \cos hw + 189 \cos 2hw - 84 \cos 3hw - 30 \cos 4hw + 12 \cos 5hw \\
+3 \cos 6hw - 132h^2 \omega^2 - 136h^4 \omega^4 - 66h^2 \omega^2 \cos hw + 51h^2 \omega^2 \cos 2hw \\
+297h^2 \omega^2 \cos 3hw - 108h^2 \omega^2 \cos 4hw + 88h^4 \omega^4 \cos hw - 39h^2 \omega^2 \cos 5hw \\
-3h^2 \omega^2 \cos 6hw + 16h^4 \omega^4 \cos 2hw + 28h^4 \omega^4 \cos 3hw + 8h^4 \omega^4 \cos 4hw \\
-4h^4 \omega^4 \cos 5hw + 384h^3 \omega^3 \sin hw - 48h^3 \omega^3 \sin 2hw + 36h^3 \omega^3 \sin 3hw \\
-104h^3 \omega^3 \sin 4hw + 4h^3 \omega^3 \sin 5hw + 108hw \sin hw + 261hw \sin 2hw \\
-234hw \sin 3hw - 48hw \sin 4hw + 42hw \sin 5hw + 9hw \sin 6hw - 162
\end{bmatrix}
\]

2.4.2. Zero stability of the block

\[
\tilde{\rho}(\lambda) = \det \left[ \lambda A^{(1)} - A^{(0)} \right] = 0
\]

where \( A^{(0)}, A^{(1)} \) are from (13)

\[
\lambda \begin{bmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{bmatrix} - \begin{bmatrix} 0 & 1 & 0 \\ 0 & 0 & 1 \\ 0 & 0 & 0 \end{bmatrix} = \det \begin{bmatrix} \lambda & -1 & 0 \\ 0 & \lambda - 1 & 0 \\ 0 & 0 & \lambda - 1 \end{bmatrix}, A^2 - \lambda = \lambda (\lambda - 1) = 0
\]

Thus, solving for \( \lambda \)

\[
\lambda (\lambda - 1) = 0
\]

which implies that \( \lambda_1 = 0, \lambda_2 = 1 \) Hence, using theorem 1, theorem 2, theorem 3, the block method (13) is zero stable and also consistent as its order \( p = [2, 2]^T > 1 \), thus it is convergent.

2.4.3. Linear stability

Applying the test equation \( y^{(k)} = A^{(k)} y_n \) to yield \( y_{n+1} = \mu(z) y_n \), \( \mu(z) \) is the amplification equation given by

\[
\mu(z) = -\left( A^{(1)} - zB^{(1)} - z^2 \beta^{(1)} - z^3 \xi^{(1)} \right)^{-1} \left( A^{(0)} + zB^{(0)} + z^2 \gamma^{(0)} \right)
\]

where \( A^{(0)} = \begin{bmatrix} 0 & 1 & 0 \\ 0 & 0 & 1 \\ 0 & 0 & 0 \end{bmatrix}, B^{(0)} = \begin{bmatrix} 0 & \beta_{01} & 0 \\ 0 & \beta_{02} & 0 \\ 0 & 0 & 0 \end{bmatrix}, \gamma^{(0)} = \begin{bmatrix} 0 & 0 & \xi_{11} \\ 0 & 0 & \xi_{21} \\ 0 & 0 & 0 \end{bmatrix}, A^{(1)} = \begin{bmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{bmatrix}, B^{(1)} = \begin{bmatrix} 0 & \beta_{11} & \beta_{21} \\ 0 & \beta_{12} & \beta_{22} \\ 0 & 0 & 0 \end{bmatrix} \text{ and } \gamma^{(1)} = \begin{bmatrix} \gamma_{11} & \gamma_{12} & \gamma_{21} & \gamma_{22} \end{bmatrix} \]

the matrix \( \mu(z) \) has eigenvalues \( (0, 0, \ldots, \xi_k) \) where \( \xi_k \) is called the stability function which is the rational function with coefficients.

\[
\mu(z) = \begin{bmatrix}
136h^5 z^4 \omega^4 - 2816h^4 z^2 \omega^4 - 180h^3 z^5 + 280h^3 z^4 \omega^2 \\
+960h^2 \omega^4 + 270h^2 z^3 \omega^2 - 246h^2 z^4 + 369z^2 \\
-288h^2 z^4 \omega^4 + 288h^2 z^2 \omega^4 - 1260h^2 z^4 \omega^2 \\
+360h^2 z^4 \omega^2 - 960h^2 \omega^4 + 150h^2 z^5 + 2100h^2 z^2 \omega^2 \\
+162h^4 z^4 - 342h^4 z - 225z^2 \\
0
\end{bmatrix}
\]

2.4.4. Region of absolute stability

The region of absolute stability of the block method (13) is shown in Figure 2.

3. Numerical Experiments

Evaluating the performance of the new block method on some challenging stiff and oscillatory problems which appeared in literature and compared the results with solution from some methods.

The following notations were used in table:
- $h$ Step size
- MAXE Maximum Error
- 3BBDF 3-point block backward differentiation formula
- 3BEBDF 3-point block extended backward differentiation formula

**Example I:** Consider a linear oscillatory problem in the interval $0 \leq x \leq 10$

\[
\begin{align*}
    y_1' &= 9y_1 + 24y_2 + 5 \cos x - \frac{1}{3} \sin x \\
    y_2' &= -24y_1 - 5y_2 - 9 \cos x + \frac{1}{3} \sin x
\end{align*}
\]

\[
\begin{pmatrix}
    y_1(0) \\
    y_2(0)
\end{pmatrix} = \begin{pmatrix}
    4 \\
    4
\end{pmatrix}
\]

The exact solution is given as

\[
\begin{pmatrix}
    y_1(x) \\
    y_2(x)
\end{pmatrix} = \begin{pmatrix}
    4e^{-x} - 3e^{-1000x} \\
    -2e^{-x} + 3e^{-1000x}
\end{pmatrix}
\]

Source: [25]

Table 1 shows that the new methods performed accurately and approximate better than the result of [25]. For instance, at $h = 10^{-5}$, the error in [25] are 7.16727e(−004) and 8.53717e(−004) respectively, while the error in case 1 and case 2 are 2.6585e(−05) and 1.0017e(−05) respectively. The comparison of error in Figure 3 clearly shows that, the new methods converge better than the existing method.

Example II: Consider the linear stiff system in the interval $0 \leq x \leq 10$

\[
\begin{pmatrix}
  y'_1 \\
  y'_2
\end{pmatrix} = \begin{pmatrix}
  -100 & 9.901 \\
  0.1 & -1
\end{pmatrix} \begin{pmatrix}
  y_1 \\
  y_2
\end{pmatrix}, \quad \begin{pmatrix}
  y_1(0) \\
  y_2(0)
\end{pmatrix} = \begin{pmatrix}
  1 \\
  10
\end{pmatrix}
\]

The eigenvalues of the Jacobian matrix of the system are $\lambda_1 = -0.99$ and $\lambda_2 = -100.01$. The exact solution is given as

\[
\begin{pmatrix}
  y_1(x) \\
  y_2(x)
\end{pmatrix} = \begin{pmatrix}
  \exp(-0.99x) \\
  10 \exp(-0.99x)
\end{pmatrix}
\]

Source: [25]

Table 2 shows that the new methods performed accurately and approximate better than the result of [25]. At $h = 10^{-6}$, the error of [25] are 9.18939e(-006) and 1.09259e(-005), while the error in case 1 and case 2 are 4.3258e(-07) and 7.4327e(-09) respectively. This clearly shows that the new methods performed better than of [25]. The comparison of error in Figure 4 clearly shows that, the new methods converge better than the existing method.

Example III: Consider a linear oscillatory problem in the interval $0 \leq x \leq 10$

\[
\begin{pmatrix}
  y'_1 \\
  y'_2
\end{pmatrix} = \begin{pmatrix}
  -2y_1 + y_2 + 2 \sin x \\
  998y_1 - 999y_2 + 999 (\cos x - \sin x)
\end{pmatrix}, \quad \begin{pmatrix}
  y_1(0) \\
  y_2(0)
\end{pmatrix} = \begin{pmatrix}
  2 \\
  3
\end{pmatrix}
\]

The exact solution is given as

\[
\begin{pmatrix}
  y_1(x) \\
  y_2(x)
\end{pmatrix} = \begin{pmatrix}
  2 \exp(-x) + \sin x \\
  2 \exp(-x) + \cos x
\end{pmatrix}
\]

Source: [26]

Table 3 shows that the new methods performed accurately and approximate better than the result of [26]. From the result obtained for example III as shown in the Table 3, it is evident that the class of third derivative trigonometrically fitted method

performed better than those of [26]. The comparison of error in Figure 5 clearly shows that, the new methods converge better than the existing method.

Example IV: Consider the following linear systems

$$
\begin{align*}
    y_1'(x) &= -21y_1 + 19y_2 - 20y_3 \\
    y_2'(x) &= 19y_1 - 21y_2 + 20y_3 \\
    y_3'(x) &= 40y_1 - 40y_2 - 40y_3
\end{align*}
$$

The exact solution is given as

$$
\begin{pmatrix}
    y_1(x) \\
    y_2(x) \\
    y_3(x)
\end{pmatrix} =
\begin{pmatrix}
    \frac{1}{2} \left( e^{-2x} + e^{-40x} \cos(40x) + \sin(40x) \right) \\
    \frac{1}{2} \left( e^{-2x} - e^{-40x} \cos(40x) + \sin(40x) \right) \\
    \frac{1}{2} e^{-40x} \cos(40x) + \sin(40x)
\end{pmatrix}
$$

Source: [2]

We compared the results of CASE I and CASE II along side OHBM by comparing the maximum relative errors over the three components $y_1(x), y_2(x)$ and $y_3(x)$. As shown in Table 4, the new methods in case I and case II proved to be superior in terms of accuracy and computation time.

Results of CASE I and CASE II was compared with [24] as shown in Table 5. The new methods compute favorably with [24] and has better consistency.

4. Conclusion

A class of third derivative continuous block methods for the solution of stiff and oscillatory problems is constructed using collocation and interpolation technique. The approximate solution adopted for the development of the methods comprises of a combination of polynomial and trigonometric functions. A consistent, zero stable and convergent block methods with continuous coefficients are developed and implemented by writing a code using MATLAB 8.5. The methods are presented in continuous and discrete form.

The accuracy of the block methods were tested on some stiff and oscillatory IVP to generate results and compared the results with the results of some existing methods. The results of the new methods compete favorably with the existing methods with better accuracy, consistency and computational time. Thus the methods are consistent, convergent and zero stable. Hence the methods derived are suitable for solving stiff and oscillatory problems and computationally reliable.
